

**Bonnefire Coalition Activists to Speak on Global Atmospheric Experiments
Tuesday, August 24, 7PM at Dionondehowa School**

On Tuesday, August 24, at 7PM The Bonnefire Coalition will present an informational meeting at Dionondehowa Wildlife Sanctuary & School, 148 Stanton Road, Shushan, NY. The program will describe current and proposed atmospheric experiments which are capable of affecting the weather and public health. It will conclude with global activism which is responding to geoengineering techniques, both proposed and already implemented.

Cynthia Pikoulas, from Long Island, NY, will present aspects of the research she is doing for the Bonnefire Coalition which “connects the dots” among corporations and individuals.

Bonnie Hoag, founder of the Bonnefire Coalition, states that it was initiated to build public awareness regarding what NASA calls Persistent Jet Contrails (PJs). These are the jet contrails which do not evaporate but rather plume and combine until they haze the Sky and dim the Sun. The Bonnefire Coalition has evidence that these are not commercial jet contrails as the U.S. Air Force, NASA, and other agencies assert but rather part of a program which is witnessed and recorded, both daily and globally.

In November of 2009, specific atmospheric experiments became public when geoengineering scientists began giving testimony before the U.S. House Committee on Science & Technology. Their testimony describes proposed techniques, such as Solar Radiation Management (SRM), intended to mitigate global warming by reflecting the Sun’s heat away from Earth. When described, SRM sounds remarkably like the artificial haze people are already witnessing, daily and globally. Testimonies state that SRM could use military aircraft to disperse reflective particles in the Earth’s upper atmosphere, creating a global haze. Some particulates being considered are aluminum oxide, sulfur dioxide and designer nano-particles. According to Ms. Hoag this is but one of the “Dr. Strangelove solutions being promoted, both domestically and abroad.”

“In general,” says Pikoulas, “people are unaware of the techniques being planned and the commercial interests which are fast-tracking the implementation. While there has been some media discussion of geoengineering techniques, overall the media blackout continues regarding the effects of these and existing programs such as HAARP - DARPA’s High-frequency Active Auroral Research Program, CARE - NASA/Navy’s Charged Aerosol Release Experiment, weather manipulation for military purposes, and a history of planned military use of aerosols and insects as ‘non-lethal weapons’.”

Hoag and Pikoulas will discuss the small group of individuals and corporations who make global decisions out of the reach the democratic process. Hoag will conclude by describing the vitality of the international community in rising up to counter the expanded use of the Earth’s atmosphere for military purposes and experiments which are ongoing without public awareness or permission.

The Bonnefire Coalition website is accessible at www.agriculturedefensecoalition.org where the public is invited to begin or continue its own research.
